Valtek Mark Two
Control Valves

Valtek Mark Two

Body Assembly

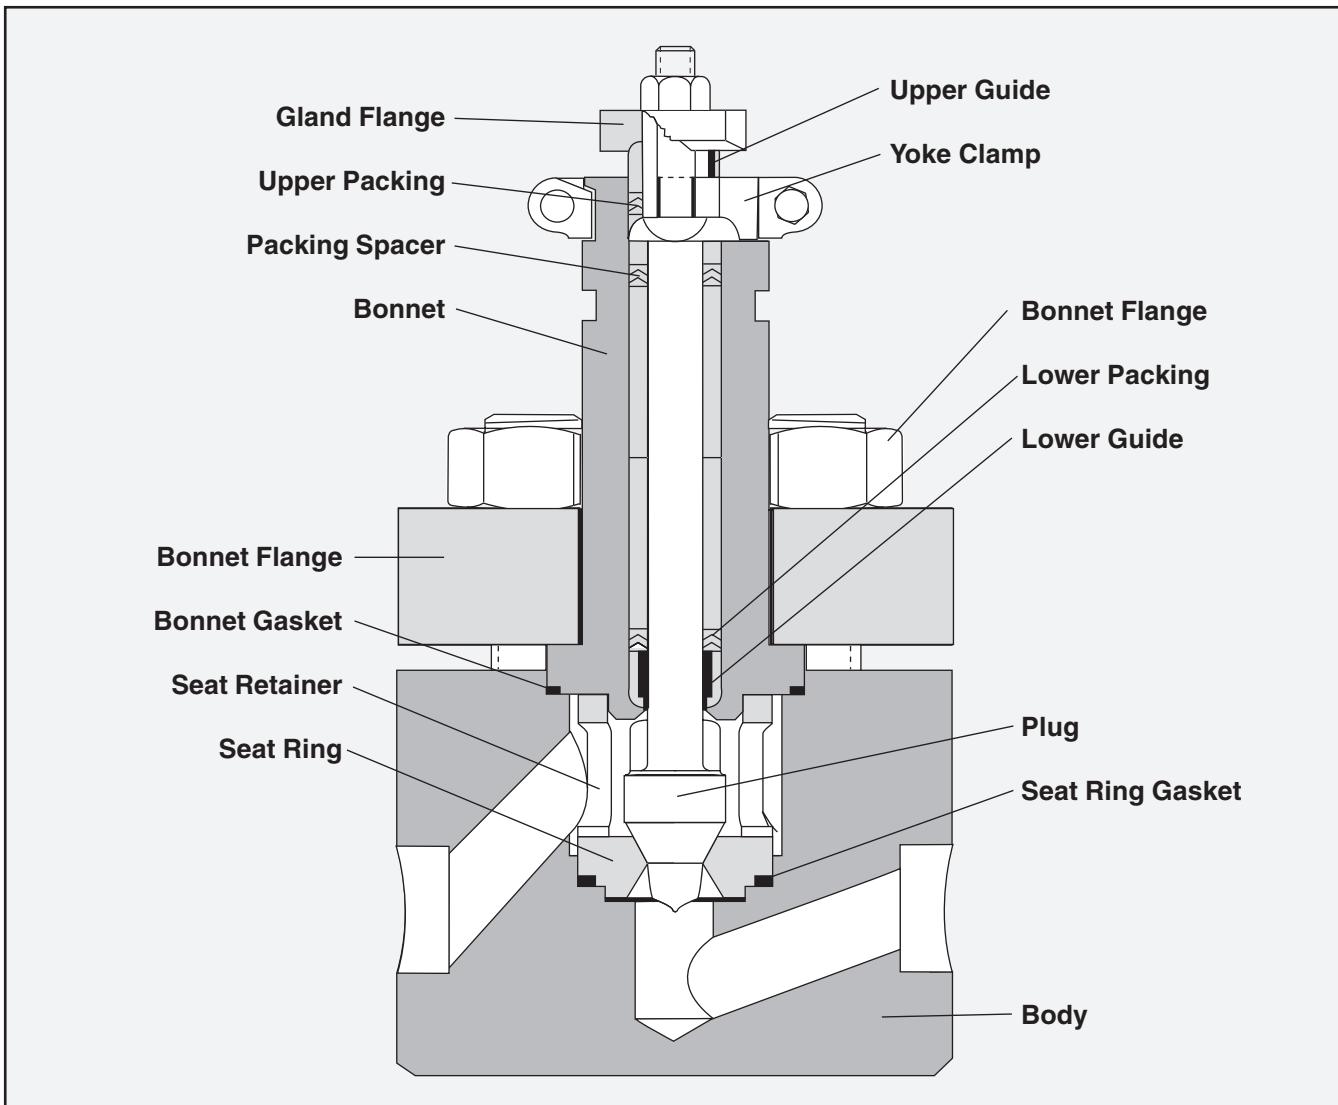

Figure 1: Mark Two Body Assembly

The Valtek® Mark Two™ control valve, available in many different configurations, is an extremely versatile automatic control valve. Fabricated from bar stock, it can be machined without foundry delays, even in high pressure classes or special alloys. This valve is generally available in sizes from 1/2 to 2-inch, but special configurations can be built to 6-inch.

The preferred body design is with socket-weld ends, but grayloc, butt-weld, flanged, and screwed ends are also available in ratings from 150 to 2500 psi / 10.3 to 172.4 bar, with special applications to 15,000 psi / 1034 bar.

Offset globe construction is generally less expensive than in-line construction.

Most common maintenance problems with comparable globe valves are associated with cage guiding - where close metal-to-metal contact between the cage and plug often results in galling and binding. Conversely, the Mark Two is double-stem guided, completely avoiding contact between the plug and seat retainer. Top entry trim with a clamped-in seat also permits easy, quick maintenance.

Valtek Mark Two

Body Styles

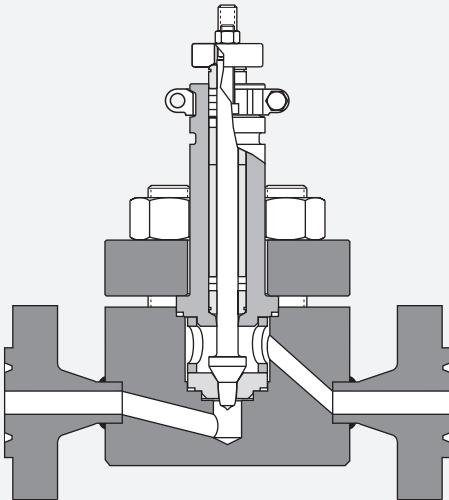

Figure 2: In-Line Globe

This design, built to accommodate in-line piping systems, requires slightly more difficult and expensive angle-drilling of the bar stock. Complete valve trim (plug, seat ring, and retainer) is interchangeable regardless of body design (in-line, offset or angle). It is often interchangeable with Valtek Mark One control valves with identical pressure ratings.

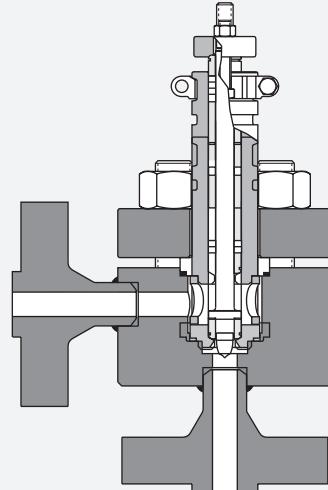

Figure 3: Angle Body

For interchangeability, only the body differs between globe and angle valves – all other parts are the same. This construction is available with outlets larger than inlet size for high pressure drop applications. The seat ring, when required, can be constructed to extend to the outlet flange, providing a venturi lining for the outlet passage.

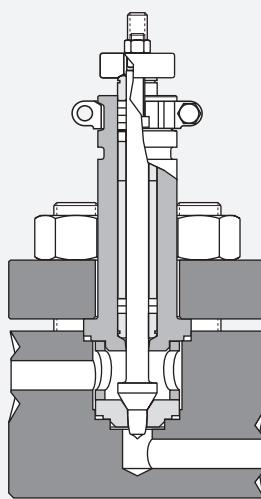

Figure 4: Offset Globe

When inlet and outlet piping can be offset, this design is the simplest, least expensive Valtek Mark Two control valve bar stock valve. Like the in-line and angle bodies, this design maintains the same interchangeability associated with Valtek Mark One control valves.

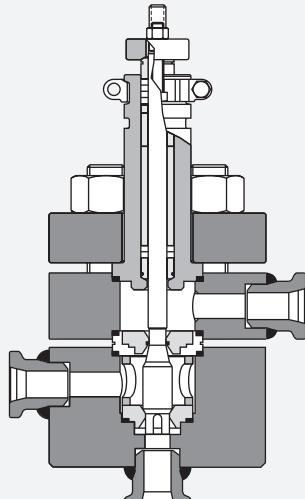

Figure 5: Three-way Body

One style is used for both combining and diverting services. For interchangeability, a standard Mark Two body converts to a three-way body with the addition of a three-way adapter, upper seat ring, three-way plug, two gaskets, and longer studs.

Valtek Mark Two

End Connections, Flanges, Bolting and Clamps

End Connections

The basic preferred end connection for Mark Two control valves is the socket weld because the socket can be machined into the bar stock body. Socket weld bodies are often available from stock. Other end connections can be fabricated from socket-weld body blanks. A wide variety of configurations and face-to-face dimensions is easily available by fabricating to the basic socket-weld construction.

Ratings

While the Mark Two control valve design is basically for ratings of 900 lbs. / 1984 kg. and above, when fast delivery of special alloys or extensive material certifications and examinations is demanded by the application, pressure ratings less than 900 lbs. / 1984 kg. are available at a somewhat greater cost than standard cast bodies.

Bonnet Flange

Bonnet flanges are separable and are furnished in carbon steel. Stainless or other materials can be supplied where required by process atmospheres or extreme temperatures.

Bonnet Flange Bolting

Standard bolting is grade B7 studs and 2H nuts — suitable for -20° to 1000°F / -29°C to 538°C. Studs and nuts in 316 stainless steel are suitable for -423° to 1500°F / -253°C to 816°C.

These temperature limits are for maximum pressures permitted by ANSI B16.5. Special alloy steels are available for higher pressures and temperatures.

Yoke Clamps

The actuator is usually attached to the Mark Two control valve body assembly with two precision cast, stainless steel yoke clamps, although in some cases the actuator is bolted directly to the bonnet. Each clamp has an inclined plane surface which, when bolted together, securely fastens the actuator yoke to the bonnet. Unlike conventional threaded clamps, Flowserve's clamp design permits easy removal even under extreme corrosive conditions.

Associated bolts and locknuts are supplied in plated carbon steel, although stainless steel is also available when required.

Figure 6: End Connections

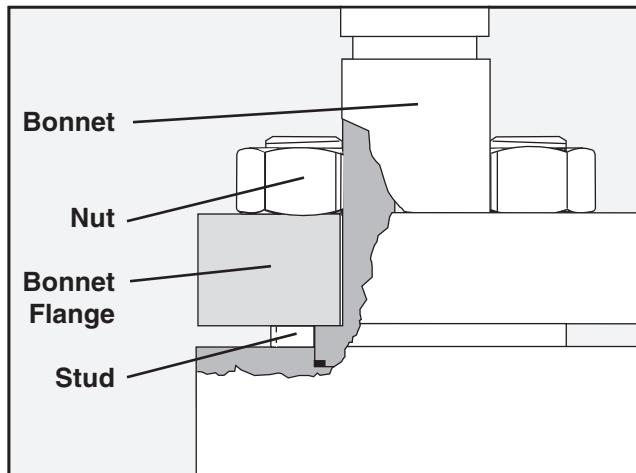

Figure 7: Bonnet Flange and Bolting

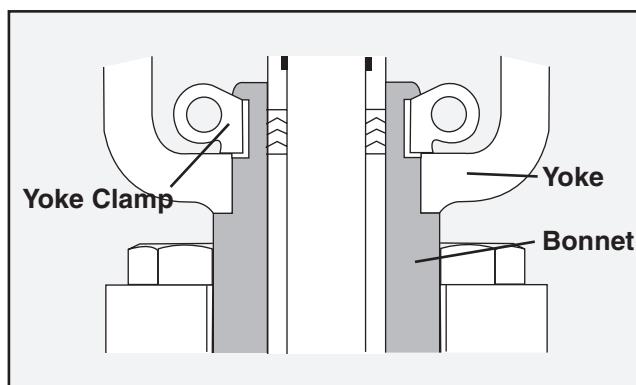

Figure 8: Yoke Clamp

Valtek Mark Two

Gaskets

The Mark Two control valve is designed with the bonnet and seat ring gaskets fully retained. Since the bonnet bottoms metal-to-metal in the body, the bonnet gasket compression is determined by the depth of the gasket step on the bonnet which is machined to provide the compression required by the gasket manufacturer.

When the bonnet is fully installed, force is transmitted through the seat retainer to secure the seat ring in position. The body, seat retainer and seat ring are all machined to close tolerances to provide the proper seat gasket compression. Unlike the bonnet, the seat ring does not bottom in the body, allowing this small clearance to compensate for manufacturing tolerances and thermal expansion.

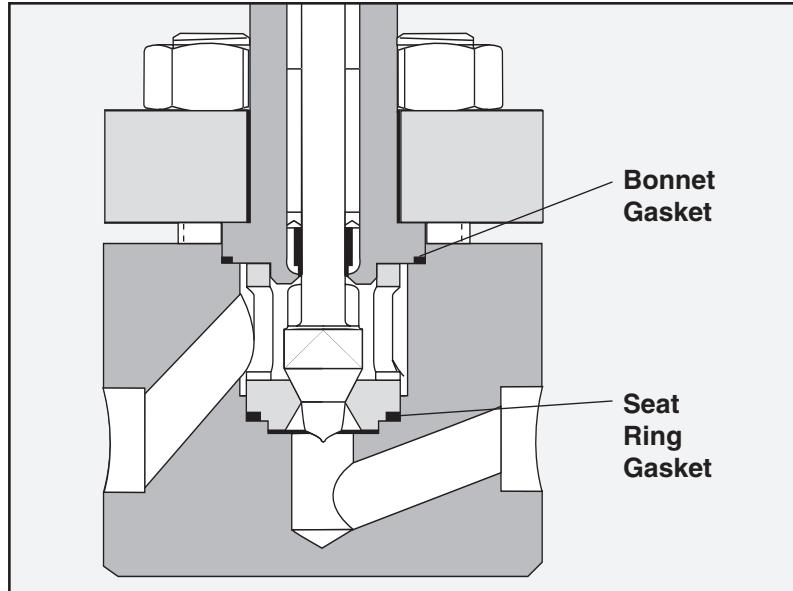

Figure 9: Seat Retainer Installation

Table I: Gasket Specifications

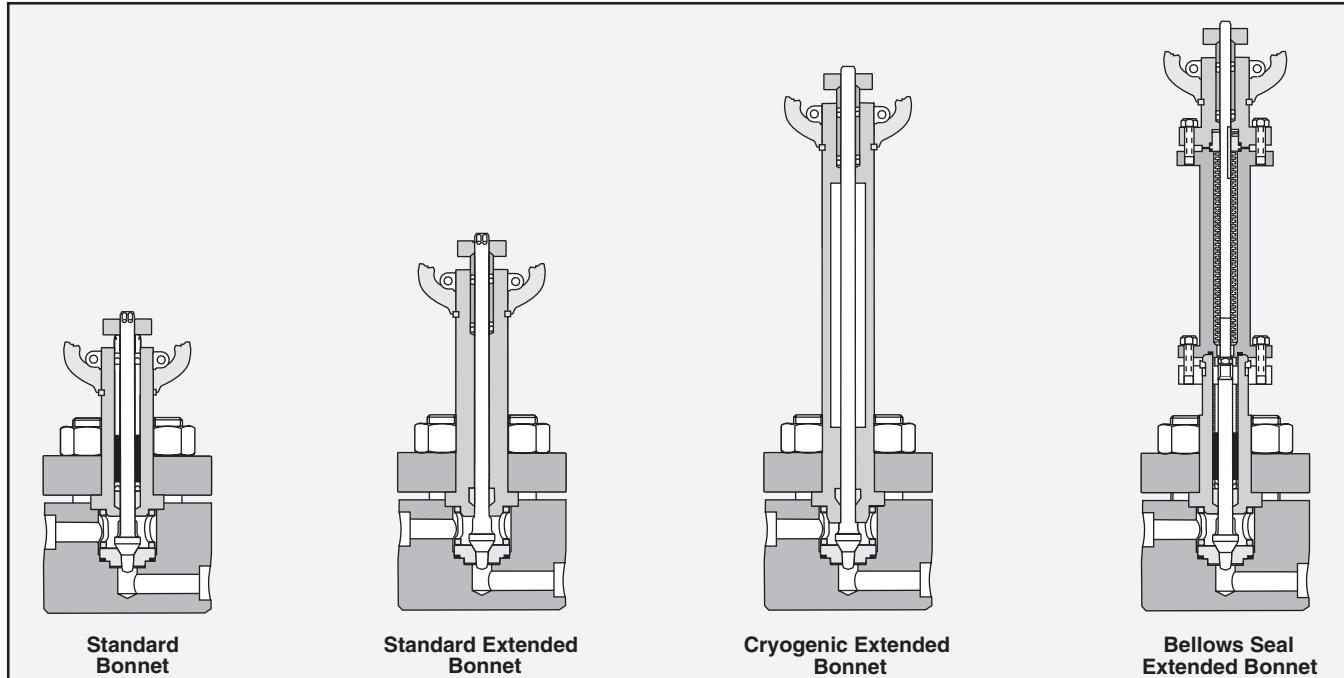

| | Body Material | Type | Gasket Material | Maximum Gasket Temp. ° F / ° C | Minimum Gasket Temp. ° F / ° C |
|--------------------------|---------------------|---------------|-------------------|--------------------------------|--------------------------------|
| Standard Gaskets | Carbon Steel | Spiral Wound | 304 SS / asbestos | 750 / 399 | -20 / -29 |
| | Carbon-Moly | Spiral Wound | 316 SS / asbestos | 1000 / 538 | -20 / -29 |
| | 316 Stainless Steel | Flat | PTFE | 450 / 232 | -320 / -196 |
| | | Spiral Wound | 316 SS / asbestos | 1000 / 538 | -20 / -29 |
| | Other Alloys | Flat | PTFE | 450 / 232 | -320 / -196 |
| Alternate Gaskets | As required | Flat | Asbestos | 600 / 316 | -20 / -29 |
| | | Flat | PTFE | 450 / 232 | -320* / -196 |
| | | Flat | PCTFE | 350 / 177 | -320* / -196 |
| | | Flat | Graphite** | 1500 / 816 | -320 / -196 |
| | | Spiral Wound | 316 SS / Graphite | 1500 / 816 | -320 / -196 |
| | | Hollow O-ring | INCONEL X-750 | 1500 / 816 | -20* / -196 |

* Lower temperature on request.

** Limited to 900°F / 482°C for oxidizing service.

Valtek Mark Two

Bonnet Types

Standard Bonnet

The Mark Two bonnet is usually constructed out of the same material as the body and handles temperatures from -20° to 850°F / -29°C to 454°C (see Table 4 on page 9 of *Valtek Mark One Control Valves* for packing limitations); however, special packing must be considered at temperatures above 450°F / 232°C.

Extended Bonnet

The extended bonnet protects the packing from excessive heat or cold which may inhibit valve performance. It is constructed of carbon steel for temperatures from -20° to 800°F / -29°C to 427°C and of 304 or 316 stainless steel for temperatures from -320°F to 1500°F / -196°C to 816°C.

Cryogenic Extended Bonnet

The cryogenic extended bonnet permits stagnated, moderate temperatures gas to form in the bonnet, which protects the packing from the service fluid. It is usually manufactured from 304 to 316 stainless steel and handles temperatures down to -423°F / -253°C. Standard construction consists of stainless steel bonnet flange and bolting.

Bellows Seal Extended Bonnet

The bellows seal extended bonnet can be used whenever service fluid leakage to atmosphere needs to be reduced to an absolute minimum.

The standard metal bellows seal is rated for operation at 150 psi / 10.3 bar at 100°F / 38°C or 90 psi / 6.2 bar at 600°F / 316°C; special designs are available for pressures to 2900 psi / 200 bar and temperatures at 1100°F / 593°C.

The flexible metal bellows is usually constructed of 316L stainless steel. Bellows can also be furnished in alloys, such as Hastelloy and Inconel.

The bellows seal design allows for outside pressure to minimize bellows squirm, prolonging bellows life. Average full stroke cycle life that can be expected is shown in Table V.

The standard bellows, shown above, can be rated at other pressure, temperature or cycle life. Pressure ratings can be increased by reducing the calculated cycle life or by using special, short stroke plugs. Cycle life can be increased by reducing operating pressures or using short stroke plugs.

Since bellows seals are designed for specific service conditions and not to the valve's design class, it is necessary to include complete and accurate service conditions when specifying.

Valtek Mark Two

Trim Materials, Data

Trim Materials

Standard plug and seat ring material is 316 stainless steel except in the case of alloy bodies where trims are often furnished in the same material as the body.

Although it is difficult to assign specific limitations to the use of stainless steel due to insufficient information about the actual condition of the flowing stream, a wide variety of services are successfully handled by stainless steel trim parts. Nevertheless, a general rule is to consider hard trim for all choked flow conditions or for temperatures above 600°F / 316°C.

Valtek stocks Alloy 6 for many valve trim parts. This material offers a good combination of relative hardness and corrosion resistance. Special alloys such as Alloy 20, Hastelloy C and Monel, are also available.

Flowserve Corporation has established industry leadership in the design and manufacture of its products. When properly selected, this Flowserve product is designed to perform its intended function safely during its useful life. However, the purchaser or user of Flowserve products should be aware that Flowserve products might be used in numerous applications under a wide variety of industrial service conditions. Although Flowserve can (and often does) provide general guidelines, it cannot provide specific data and warnings for all possible applications. The purchaser/user must therefore assume the ultimate responsibility for the proper sizing and selection, installation, operation and maintenance of Flowserve products. The purchaser/user should read and understand the Installation Operation Maintenance (IOM) instructions included with the product, and train its employees and contractors in the safe use of Flowserve products in connection with the specific application.

While the information and specifications presented in this literature are believed to be accurate, they are supplied for informative purposes only and should not be considered certified or as a guarantee of satisfactory results by reliance thereon. Nothing contained herein is to be construed as a warranty or guarantee, express or implied, regarding any matter with respect to this product. Because Flowserve is continually improving and upgrading its product design, the specifications, dimensions and information contained herein are subject to change without notice. Should any question arise concerning these provisions, the purchaser/user should contact Flowserve Corporation at any of its worldwide operations or offices.
